Python code arduously written in 2022/2023 and translated into english in 2026.

The available Python script meets the objective described in the *Build it* (§ 5) of the documentation. Namely, to be invoked from the command line and to take a `.vm` file (or a directory of `.vm` files) as input to produce a `.asm` file (or a series of corresponding `.asm` files). But it does not follow the *Design Suggestion* of the documentation (§ 3.3).

The code has been retested in 2026 against the following project directories :

`FunctionCalls\FibonacciElement`

`FunctionCalls\NestedCall`

`FunctionCalls\SimpleFunction`

`FunctionCalls\StaticsTest`

`ProgramFlow\BasicLoop`

`ProgramFlow\FibonacciSeries`

Test sequence example :

- Recreate `FibonacciElement.asm` by using the following kind of command :

```
VMTranslator.bat FunctionCalls\FibonacciElement > VMTranslator.out
```

- Open the CPU Emulator (`tools\CPUEmulator.bat` on Windows).

- *File* / *Load Script* / Open `FunctionCalls\FibonacciElement\FibonacciElement.tst`

- Run it (preferably in fast mode) and await the final message « *End of script – Comparison ended successfully* ».
