

Python code written in 2023 and translated into english in 2026 (To be honest, I started translating line by line myself, as I did for the previous projects, until I got bored or lazy. The rest of the translation was then done by [Mistral AI](#). But I checked the result, and it seemed to me that the AI did a great job).

The 2 available Python scripts fulfill the objective described in the Build it (§ 5) of the documentation in that the XML files produced all pass the `TextComparer` tests.

But the implementation here is quite different from the one suggested in the documentation.

As said above, the available code has only 2 modules and not 3 as suggested in the documentation. The API functions described in § 3 have not been implemented. And, finally, the parser does not work exactly as stated in the documentation.

More precisely :

- The tokenizer (`JackTokenizer.py`) is supposed to be invoked from the command line, to take a Jack file (or a directory of Jack files) as input and to produce a single or a series of XML files (`*T.xml`).
- The parser (`JackParser.py`), is also supposed to be invoked from the command line, but it takes a `xxxT.xml` file (or a directory of `*T.xml` files) as input to produce a single or a series of XML files (`*.xml`). So, the parser expects XML file(s) produced by the tokenizer as input and not Jack file(s).

Three bat files are also available : `JackTokenizer.bat` and `JackParser.bat` serve to call the Python tokenizer and parser respectively. And `validation.bat` check the XML output of the 2 modules by calling the `TextComparer` tool for the 3 test programs (supposed to be all located in a 'Perso' subdirectory that was created to isolate the original code).
