

Python code written in 2022 and translated into english in 2026.

The available Python script fulfills the objective described in the *Build it* § (6) of the documentation, that is to be invoked from the command line, taking a `.vm` file (or a directory of `.vm` files) as input to produce a `.asm` file (or a series of corresponding `.asm` files). But it does not follow the *Design Suggestion* of the documentation (§ 4.2).

The code has been retested in 2026 against the 5 `.vm` files of the project directory.

Example for `BasicTest.vm` :

- Recreate `BasicTest.asm` by calling `VMTranslator.bat` with the `.vm` file as input (the `.bat` script is a simple wrapper for the invocation of the Python script).
- Open the CPU Emulator and load `BasicTest.tst` script.
- Run it and await the final message « *End of script – Comparison ended successfully* ».

The `VMTranslator_check.bat` script can be used as a non-regression test tool. It recreates each one of the 5 `.asm` files and compares it against a check file supposed to be correct.
