

Python code written in 2023 and translated into english in 2026 (main part done by [Mistral AI](#)).

The 2 available Python scripts fulfill the objective described in the *Build it* section (§ 5) of the documentation, as all the XML files they produce pass the `TextComparer` tests.

However, the implementation differs significantly from the one suggested in the documentation.

As mentioned above, the available code consists of only 2 modules instead of the 3 suggested in the documentation. The API functions described in § 3 have not been implemented. Finally, the parser does not work exactly as stated in the documentation.

More precisely :

- The tokenizer (`JackTokenizer.py`) is supposed to be invoked from the command line, taking a Jack file (or a directory of Jack files) as input and producing a single or a series of XML files (`*τ.xml`).
- The parser (`JackParser.py`), is also supposed to be invoked from the command line, but it takes a `xxxτ.xml` file (or a directory of `*τ.xml` files) as input to produce a single or a series of XML files (`*.xml`). Thus, the parser expects XML file(s) produced by the tokenizer as input, not Jack file(s).

Three batch files are also available : `JackTokenizer.bat` and `JackParser.bat` are used to call the Python tokenizer and parser, respectively. And `validation.bat` check the XML output of the 2 modules by calling the `TextComparer` tool for the 3 test programs (which are supposed to be located in a 'perso' subdirectory created to isolate the original code).
